FINDING OUT THE TRUTH ABOUT VACCINES MIGHT JUST SAVE YOU FROM DISABLING COMPLICATIONS

The debates about vaccines are taking place in the media, on the internet, on YouTube, in homes and businesses. Some people take their doctor's word as law; some people are questioning the government's right to mandate vaccinations for anyone.

Across YouTube, many videos show a beautiful young woman in Virginia who received a seasonal flu vaccination and then developed a disabling neurological disease within days. Videos telling her story have been viewed more than six million times. Thousands of people comment back and forth on the tragedy or validity of her condition.

Where can we find valid truth about vaccines? Where can we find a scientific opinion or data to trust?

Dr. Gary Null has been an authority on natural methods of achieving health for more than 30-years. He has written 70 books and his radio show has aired for 27 years, among many other accomplishments. He is dedicated to giving people true information with which they can make judgments about their health. He has addressed the safety and efficacy of vaccines many times.

In a recent report, he determines some basic questions that would determine the validity of vaccines. He asks, "The first question: Are vaccines truly effective in protecting people? If they are effective, what is the proof? Did these studies compare fully vaccinated groups of individuals against groups that were non-vaccinated? Have there been trials that compared one group vaccination and another put on a lifestyle modification program?" Without answers to these questions, there is no measurement of vaccines compared to *no treatment* or lifestyle change, and no safety measure of giving multiple vaccines at one time or close together.

His second question: "Are vaccines safe? If so, what is the proof? How do we know whether a vaccinated individual who didn't come down with an infection is due to the vaccine or whether it is due to their immune system? How can we reconcile a very short timeframe used throughout vaccine trials to determine safety, when much of the scientific literature shows delayed responses for more serious adverse effects?" Without this information being freely available, consumers are running on faith when they take their doctor's word for the safety of vaccines, whether new or old.

After researching the answers to these questions himself, he said: "After spending several years researching each of these questions, our conclusions are startling. Research and statistical studies show that no single vaccine and no combination of vaccines have been proven to be effective or safe for any given individual. In addition, we found that the vaccine process does not confer the protected immunization for a given individual. To the contrary, vaccines may actually compromise and adversely altering the body's immune system."

In fact, the investigation of other sources of information than just mainstream medicine may mean the difference between health and incapacitating illness. The responsibility ultimately lies with the person who is going to receive or authorize receipt of the vaccine. The moral of the tale? Do your homework thoroughly!
